

Free Speech, For Everyone

A free, open-source AAC app that gives anyone who has difficulty speaking a voice.

Vox Libera is a free, open-source AAC (Augmentative and Alternative Communication) web app built for anyone who has difficulty speaking — due to aphasia, autism, cerebral palsy, ALS, stroke, or any other condition. Users build sentences from customizable word and picture cards and have them spoken aloud instantly, using their device's own built-in text-to-speech voices — completely free, private, and fully functional offline. There's no cost, no account sign-up, no ads, and no API keys required.

- Tap-to-speak word & picture cards, fully customizable
- Natural text-to-speech using your device's own voices — works offline
- Full-screen "big text" mode for showing sentences to others
- Personal voice recordings for instant playback
- Emergency & caregiver info stored right in the app
- Installs like a real app — no app-store fees, ever
